COMPOSTING

Ellen Phillips
June 2015

Illinois Migrant Council

Today's Objectives

- **Compost**
- Rules and Regs
- Methods of Composting
- Key Factors in Composting
- Using Compost

- **Compost:**

Organic residues, or a mixture of organic residues and soil, that have been mixed, piled, and moistened, with or without addition of fertilizer and lime, and generally allowed to undergo thermophilic decomposition until the original organic materials have been substantially altered or decomposed.

Sometimes called "artificial manure" or "synthetic manure." In Europe, the term may refer to a potting mix for container-grown plants.

- **Composting:**

A controlled biological process which converts organic constituents, usually wastes, into humus-like material suitable for use as a soil amendment or organic fertilizer.

Soil Science Society of America: Soil Glossary

<https://www.soils.org/publications/soils-glossary#>

Compost Benefits to Soil

- Improves soil structure and strength, increasing porosity and decreasing compaction
- Decreases bulk density
- Increases water infiltration, permeability and increased water holding capacity
- Increases cation exchange capacity
- Encourages soil biological community
- Modifies pH
- Suppresses plant diseases

Today's Objectives

- Compost
- **Rules and Regs**
- Key Factors in Composting
- Using Compost

Local Municipality Rules/ Codes

- Does a compost pile require a license or approval?
- May have special requirements on location of bins, types of bins, etc.
- Some don't allow food scraps

UNIVERSITY OF ILLINOIS
EXTENSION

Illinois EPA Composting Permit NOT Required if . . .

- Your farm/stable
 - your manure.
 - no additions to compost pile brought from off the farm.
- No setbacks for active composting area.
- Site is located on the farm in which the compost is applied.
- Site is operated by the farmer of the property.
- Farmland is in production of crops annually.
- Size of the compost site is less than 2% of the acreage of the property.

www.cityofchicago.org/city/en/depts/streets/supp_info/composting/composting_ordinance1.html

The screenshot shows the City of Chicago's official website. At the top, there is a navigation bar with the City of Chicago logo and the text 'The City of Chicago's Official Site'. Below this is a search bar and a menu with options: Home, City Services, People We Serve, Programs & Initiatives, Chicago Government, and About Chicago. The main header features the text 'Recycling & Waste Management' next to a photograph of a young boy in a brown shirt placing a cardboard box into a blue recycling bin. Below the header, there are social media sharing icons for Facebook, Twitter, Google+, and RSS. The main content area is titled 'Composting in Chicago' and includes a paragraph about composting and a list of three links: 'Composting Ordinance', 'Residential Composting', and 'Commercial Composting'. On the left side, there is a sidebar with sections for 'Supporting Information Facts', 'Department', 'People We Serve', 'Programs & Initiatives', and 'City Services'.

UNIVERSITY OF ILLINOIS EXTENSION

new ILLINOIS fruit & vegetable FARMERS

Organic Rule for Compost

- process that combines plant and animal materials with
- in-vessel or static aerated pile system
 - must maintain at a temperature between 131 °F and 170 ° F for 3 days.
- windrow system
 - must maintain at a temperature between 131 °F and 170 °F for 15 days, during which time, the materials must be turned a minimum of five times

www.ecfr.gov/cgi-bin/retrieveECFR?gp=&SID=2fbb9d9e19ad3c5e3266d55fec8743a9&mc=true&n=sp7.3.205.c&r=SUBPART&ty=HTML#se7.3.205_1201

Organic Guidelines

- The guidance document allows compost if
 - more flexibility in how compost piles are constructed and monitored.
 - assuming acceptable feedstocks are used
 - if the compost achieves 131°F for three days
 - the pile is mixed or managed to ensure that all of the mixture achieves this temperature
- the organic rule does NOT require that manures come from organic livestock farms to be used in organic compost production.
- National Organic Standards Board (NOSB) [addendum](#) (NOSB, 2010)

Finished Compost

- Field application based on nutrient application
- Illinois rules for applying compost
 - No setbacks
 - No permit for application
 - Default rate of 20 tons/acre/year
 - Applying more requires Illinois EPA permission

Today's Objectives

- Compost
- Rules and Regs
- **Methods of Composting**
- Key Factors in Composting
- Using Compost

Vermicomposting

Compost produced using red-wiggler worms to decompose materials

National Organic Program compost requirements can also be met by vermicompost

Requirements:

- a. It is made from allowed feedstock materials
(either nonsynthetic substances not prohibited at §205.602, or synthetics approved for use as plant or soil amendments);
- b. Aerobicity is maintained by regular additions of thin layers of organic matter at 1–3 day intervals
- c. Moisture is maintained at 70–90%
- d. The duration of vermicomposting is at
 - a. 6–12 months for outdoor windrows
 - b. 2–4 months for indoor container systems
 - c. 2–4 months for angled wedge systems
 - d. 30–60 days for continuous flow reactors

~ NOP, 2010b

In-Vessel Composting

- Uses a motor to turn
- Very rapid process
- Relatively high cost
- Can use everything from small barrel to cement mixer or larger

www7.tamu-commerce.edu/agscience/res-dlc/horse/horse.html

www.mn.nrcs.usda.gov/partnerships/pembina/in-vessel_composter.htm

Passively aerated windrows

Ellen Phillips

Tube for air flow
Either **inflow** or
suction

- Mixed materials built on bed with aeration tubes embedded
- Normally not turned
- Not as uniformly composted
- Aeration by mechanical blowers or vacuum
- Composting ~ 30 days
- Followed by curing ~ 30 days

Piles/ Windrow

- Flexible size
- Hand or machine turned

Ellen Phillips

Ellen Phillips

Today's Objectives

- Compost
- Rules and Regs
- Methods of Composting
- **Key Factors in Composting**
- Using Compost

Rotting vs. Composting

Decompose

- *verb* de·com·pose \,dē-kəm-'pōz\
: to cause something (such as dead plants and the bodies of dead animals) to be destroyed and broken down by natural biological processes, chemicals, etc.

<http://www.merriam-webster.com/dictionary/decompose>

Microbe Mix

- Bacteria
 - Primary decomposers
 - Create the heat in the pile
- Fungi
 - Primary decomposers
 - Better at decomposing wood materials
 - Important in curing and binding particles together
- Biological community
 - Everything else
 - Add soil to compost pile to inoculate

What do they need
live and multiply?

- Water films to live in
- Source of food
 - Need carbon for energy
 - Need nitrogen for proteins
- Need air

*Composting Goal!
Keep them happy and multiplying*

Passive/ Inactive/ Cold Compost

- Pile of organic materials left alone to decompose over an extended period of time
- may or may not use a compost recipe
- no attempt to adjust moisture content or the C:N ratio
- not aerated
- temperatures are not monitored
 - Pile may not heat to kill pathogens or weed seeds
- May turn anaerobic
 - Foul odors
- ***not approved for certified organic production.***

Active/ Hot Composting

- Encourage microbes to multiply and decompose organic materials
- Pay attention to:
 - Pile Size
 - Carbon to nitrogen ratio
 - pH
 - Moisture content
 - Aeration
 - Temperature

UNIVERSITY OF ILLINOIS
EXTENSION

Sources of information

- Midwest Extension Composting School
 - Focus on the science of large-scale composting

The Composting Process

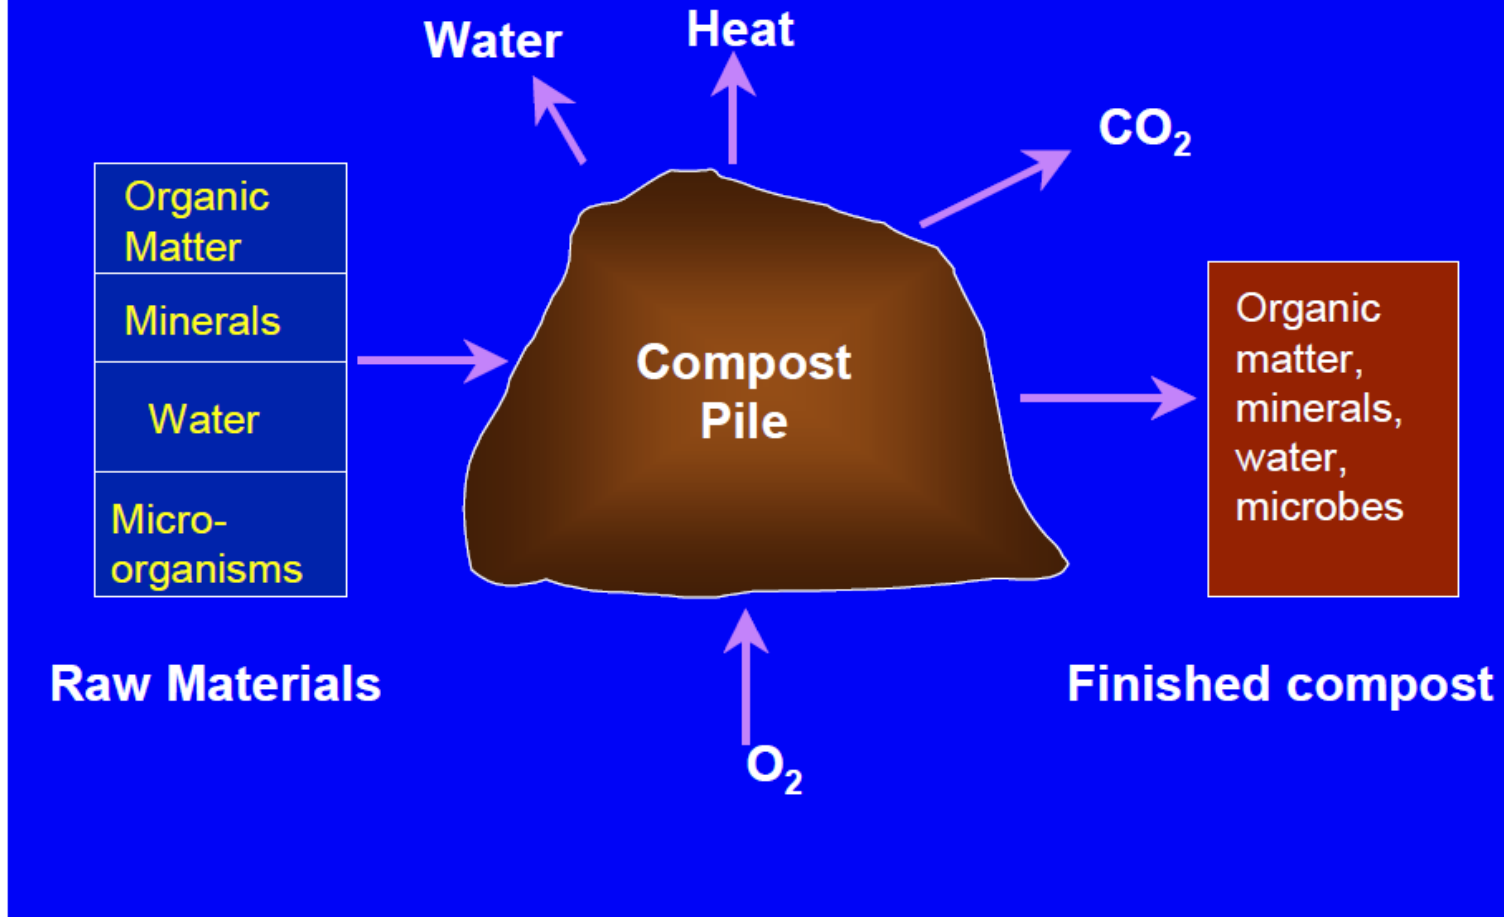

Figure 1. The Composting Process. Adapted from Rynk,

Recordkeeping

- Compost recipe
- Daily temperatures
- Moisture content
- Oxygen content
- Turning
- Curing time
- Use

Key Factors in Composting

- **Pile Size**
- Carbon to nitrogen ratio
- pH
- Moisture content
- Aeration
- Temperature

Bins/ piles/ rows

Ellen Phillips

Ellen Phillips

Ellen Phillips

Ellen Phillips

Bin Construction

- Bin size
 - Depends on equipment - width fit to your equipment
 - Minimum 3'x3', any length
 - Maximum – what equipment can turn 10'x10', any length
- Bin materials
 - Any materials
 - Do not need a bin, piles can do fine
 - A roof/ tarp gives control over moisture
- Durable slab
 - May be required depending on site conditions
 - Makes it easier to use equipment
- Water available to adjust moisture

Ellen Phillips

Where should the pile/row go?

- Away from surface water
- Space to turn equipment
- Access in bad weather
- Shade doesn't matter (heat comes from microbes)

UNIVERSITY OF ILLINOIS
EXTENSION

Key Factors in Composting

- Pile Size
- Carbon to nitrogen ratio
- pH
- Moisture content
- Aeration
- Temperature

UNIVERSITY OF ILLINOIS
EXTENSION

Carbon to Nitrogen Ratio

(What to put in the pile)

- Desired C:N ratio for pile 30:1
- Follow compost recipe
 - <http://www.klickitatcounty.org/solidwaste/fileshtml/organics/compostcalc.htm>
 - <http://compostingtechnology.com/resources/compost-calculator-tool/>
- **Don't add:** meat, dairy, oil based items, weed seeds, diseased plant materials, pet waste

web.extension.illinois.edu/manureshare

University of Illinois Extension Manure Share

[Home](#) [Listings](#) [Rules](#) [Links](#) [Contact Us](#)

Illinois Manure Share is a free program that benefits livestock owners, gardeners, landscapers and the environment! It is a manure exchange program that brings gardeners and landscapers searching for organic materials for use in composting or field applications in contact with livestock owners who have excess manure.

The program's goal is to remove the manure from farms that do not have the acreage to adequately utilize its nutrients on their fields or pastures. This benefits water quality by removing excess nutrients from farms and by lowering the amount of commercial fertilizer used by gardeners and others.

How Does the Program Work?

[For Farms with Manure To Remove](#)

[For Those Wanting Manure](#)

UNIVERSITY OF ILLINOIS
EXTENSION

Culls and other food/ produce waste

- Problems

- High moisture content resulting in wet pile and large amount of leachate
- Sometimes hard, thick shells, rinds, etc. that do not readily decompose
- Odor production -- mainly ammonia

Ellen Phillips

- Solution

- Absorb moisture by mixing with a bulking agent to increase density
 - Use high C:N ratio materials such as leaves, sawdust , shredded newspaper
- Check pile regularly for leachate, turn pile to distribute moisture
- Leachate can be reapplied to the compost
- Grind into finer materials for even distribution in pile and greater distribution of composting microbes to speed up decomposition
- Also, reduces animal interference with the pile
- Reduce Odor - good aeration is critical

Produce/ Food composting

- Need Grinder
- Dry, high carbon materials

Ellen Phillips

Ellen Phillips

Building pile

- Add soil to inoculate with microbes
- Mix/turn materials well
- May need to add nitrogen fertilizer to balance C:N
- Should heat up within hours

Ellen Phillips

Ellen Phillips

Once a pile – it's a pile

Don't add anything else

Or

It won't finish composting!

UNIVERSITY OF ILLINOIS
EXTENSION

C:N ratio of finished compost

- Finished Compost
 - C:N < 20:N will be released
 - C:N > 30:N will be tied up
 - C:N = 20:1-30:1 very slow release of N

UNIVERSITY OF ILLINOIS
EXTENSION

Key Factors in Composting

- Pile Size
- Carbon to nitrogen ratio
- pH
- Moisture content
- Aeration
- Temperature

UNIVERSITY OF ILLINOIS
EXTENSION

pH

- pH indicates acidity or alkalinity
- pH affects nutrient availability and microbial activity
- Ideal compost between 6.0 – 8.0
- Compost range pH 5.5 – 9.0
 - Depends on source materials, compost process
 - Lime can be added to adjust pH higher
- Most manure composts have a pH of 7 or higher

Key Factors in Composting

- Pile Size
- Carbon to nitrogen ratio
- pH
- **Moisture content**
- Aeration
- Temperature

UNIVERSITY OF ILLINOIS
EXTENSION

Moisture content

- Optimal range 46% - 65%
- Monitor with moisture meter or by hand
- Dry
 - Not enough water for bacteria to live
 - Decomposition slows down
 - Solution: Add water
- Wet
 - Not enough air for microbes
 - Odor due to anaerobic digestion
 - Decomposition slows
 - Solution: turn pile, add dry materials

Ellen Phillips

Key Factors in Composting

- Pile Size
- Carbon to nitrogen ratio
- pH
- Moisture content
- **Aeration**
- Temperature

UNIVERSITY OF ILLINOIS
EXTENSION

Oxygen Content

- Atmospheric oxygen -21%
- Oxygen levels in compost air
 - < 6%, microbes die, odor
 - **Optimal 10-16%**
 - > 16% to minimize odors
- As pile heats up, more oxygen will be consumed

Ellen Phillips

Ellen Phillips

Adding air

- Heat in pile
- Turn pile
- Increase bulk density
- Put in air tubes (PVC pipes)

Key Factors in Composting

- Pile Size
- Carbon to nitrogen ratio
- pH
- Moisture content
- Aeration
- **Temperature**

UNIVERSITY OF ILLINOIS
EXTENSION

Temperature

- Moisture moderates wide swings in temperature
- Monitor with a compost thermometer
- OPTIMAL temperature
 - 130 °F – 150 °F
 - heat-loving (thermophilic) bacteria vigorously decompose organic materials
- Pathogen reduction
 - 131°F pathogens are destroyed
 - 145°F fly larvae and most weed seeds are destroyed

Ellen Phillips

Temperature

- Low temperatures $<130^{\circ}\text{F}$
 - Microbes have run out of food
 - Solution: turn pile
- Excessively high temperatures
 - $> 160^{\circ}\text{F}$
 - Microbes begin to die
 - Solution: turn pile

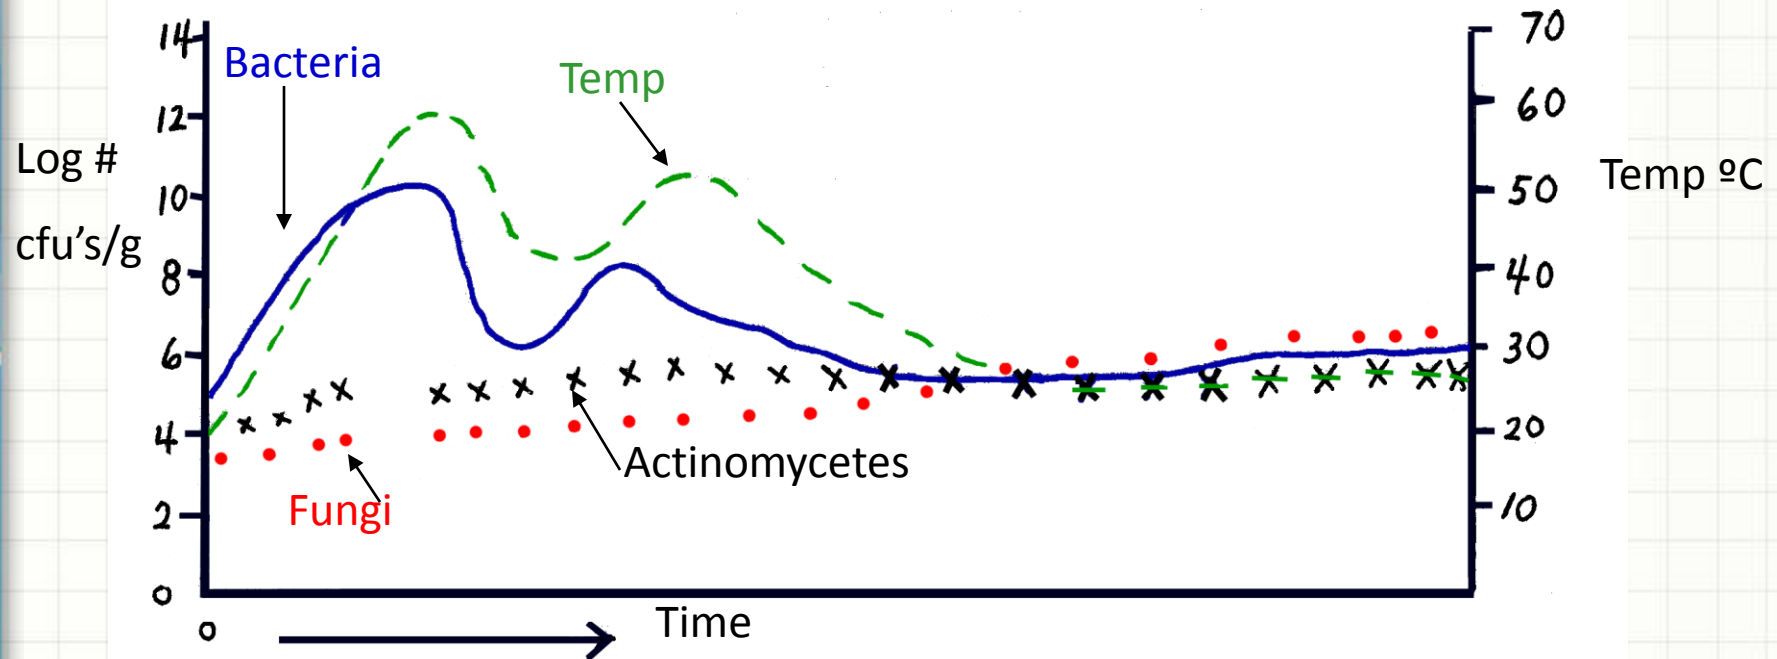

Ellen Phillips

Ellen Phillips

Ellen Phillips

Microbial Population Dynamics During Composting

$$F = C^{\circ} \times 1.8 + 32$$

Curing

Curing

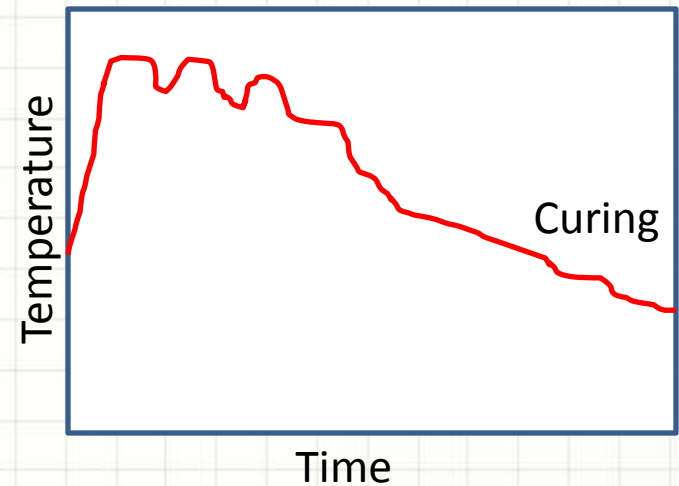

- Let it set
- Minimal time 1 month
- Reduces organic acids and other chemicals

Caution

- don't let pile go anaerobic

End

- Pile remains at air temperature
- Depends on intended use

Today's Objectives

- Compost
- Rules and Regs
- Methods of Composting
- Key Factors in Composting
- **Using Compost**

Buying Compost

- Ask for compost test results
- Buy the correct grade of compost

The screenshot shows a web browser window displaying the Composting Council's website. On the left, there is a "Member Login" section with fields for "Username" and "Password", a "Login" button, and a link for "Not a member yet? Apply here". Below this is a link that says "Click here to see STA participants ONLY" with a yellow pin icon. The main content area features a heading: "Looking for a source of quality compost? You can search our database of composter members, either by state, by company name, or by zipcode." Below the heading is a text box: "Yellow pins indicate Seal of Testing Assurance participants. For more info on the STA program, click here." The central feature is a map of the United States with numerous yellow and red pins indicating compost sources. The map shows states like Illinois, Indiana, Ohio, Missouri, Kentucky, and West Virginia, with various cities labeled. The browser's address bar shows the URL: <http://compostingcouncil.org/admin/compostmap.php>.

compostingcouncil.org/admin/compostmap.php

Free Compost?

- If compost isn't produced in a satisfactory way *with records*
 - precautions similar to those for raw manure should be used when applying it

Ellen Phillips

Finished Composted

- Once compost is finished, cover the pile to protect it from contamination.

Ellen Phillips

Ellen Phillips

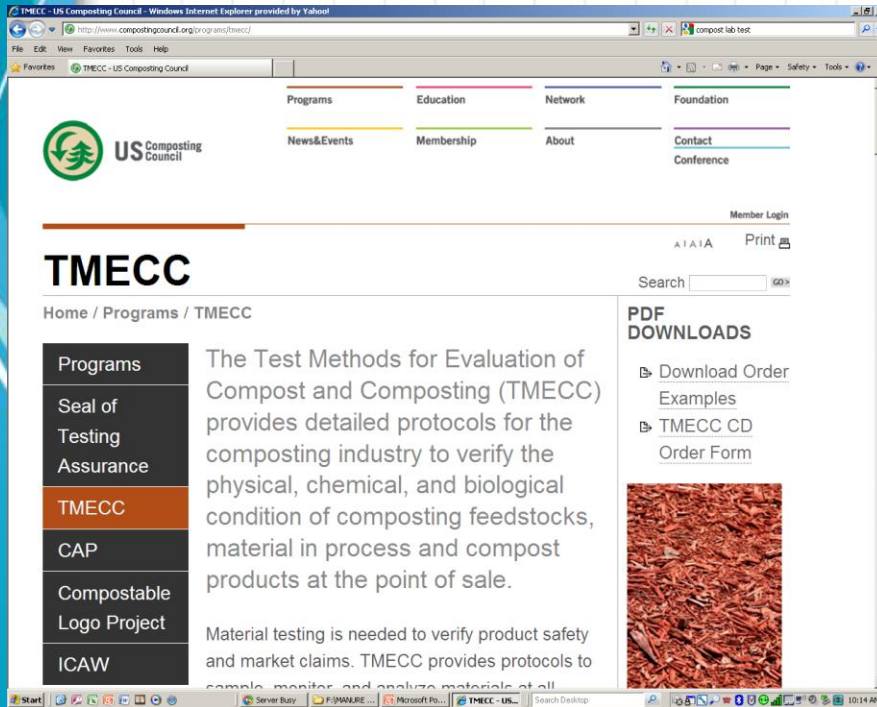

GAPs for using Compost and Teas

- Manure and compost application rules are being evaluated, should be released fall 2015
- No manure teas
- Compost tea
 - safety dependent on compost used and protection from contamination
 - Heat treatment possible to lower microbial risks
 - Not recommended for GAP

Composting Council Seal of Testing Assurance

www.compostingcouncil.org/programs/tmecc/

Certified Compost Products analyzed for:

- pH
- soluble salts
- nutrient content (total N, P2O5, K2O, Ca, Mg)
- moisture content
- organic matter content
- bioassay (maturity)
- stability (respirometry)
- particle size (report only)
- pathogen (Fecal Coliform or Salmonella)
- trace metals (Part 503 regulated metals)

Compost testing

- Many labs
- Cost
 - \$30-400

UNIVERSITY OF ILLINOIS
EXTENSION

Typical Compost Analysis

(dry weight basis)

- Total N: 3%
- NH₄-N: 500 ppm
- NO₃-N: <2 ppm
- Total P: 0.88%
- Total K: 0.83%
- pH; 7.2
- C:N ratio: 8:1
- Electrical conductivity: 3.5 mmhos/cm
- 503 metals: below EPA limits
- Moisture content: 40% water

U.S. Composting Council

UNIVERSITY OF ILLINOIS
EXTENSION

Nutrient Availability from Compost

- Compost does not steadily release nutrients
 - Suring first year
 - 10 to 25% of compost N maybe plant-available
 - 40% and 60% for P and K may be available
- these are only estimates and actual availability depends on
 - quality of the compost
 - growing season environment that affects decomposition and N mineralization

<http://www.extension.org/article/18567>

Who's going to haul it?

Ellen Phillips

- 2" of compost per acre = 300 cubic yards or 150 tons

Ellen Phillips

Record keeping – Application

- Whenever compost is applied to your land, it is important to keep good records of:
 - the date
 - amount applied
 - nutrient content
 - soil test results
 - weather conditions

UNIVERSITY OF ILLINOIS
EXTENSION

Selling Compost

Fertilizer Or Soil Amendment?

Watch your wording!

- Before selling compost check:
 - Illinois Fertilizer Act
 - Illinois Soil Amendment Act
 - Composting Permitting laws

Paul Walker

Illinois State University
compost

Summary

- Compost is an excellent soil amendment
- Know the Rules and Regs for composting in your municipality
- Key factors in composting
 - Pile size
 - Moisture content
 - Temperature
 - Carbon to nitrogen ratio
 - Aeration
 - pH
- There are numerous ways to use compost

Illinois Manure Management Plan

Illinois Manure Management Plan (IMMP)
In Illinois, there are three different manure management plans that a livestock facility might need to have. University of Illinois Extension has worked with Illinois Department of Agriculture, Illinois Natural Resources Conservation Service, and the Illinois Environmental Protection Agency to develop one website of step- by-step instructions that, if completed, will comply with the needs of all three agencies.
